

ABSTRACT OF THE DISCLOSURE

A home video server system includes a source control library and a streaming library. A stream controller is connected between the source control library and the streaming library. Moreover, a plurality of network display terminals can be connected to the streaming library via a network connection. The source control library can choose between a plurality of media sources for streaming video content. When the sources for the streaming video content change, the connection between the network display terminal and the streaming library remains the same.
